The High Plateaus

Field Log · Northern Sandstone Terraces & Wind Bearings

I. The Constant Gale

Across these elevated tablelands, the northern wind never ceases. It shears through the red rock at exactly 348 degrees North-Northwest, whistling across the open plains like an ancient subterranean flute. In my topographical survey, every weathered juniper and desert cedar bends in strict obedience to this single azimuth.

CAIRN III · BENCHMARK PLATE

II. The Benchmark Plate of Cairn III

At the eastern bluff where the plateau drops vertically into the wash, our predecessors built Cairn III. It is no mere heap of rubble: cemented into bedrock sits an engraved brass benchmark plate. Calibrating your quadrant here reveals the geodetic sighting ray toward Mesa del Sol.

III. The Broken Caravan Tracks

The red sand preserves faint, hurried wheel-ruts. The raiders who carried the stolen Astrolabe came this way, their draught beasts strained by the heavy brass mechanism. Follow their iron-shod tracks into the Sandstone Labyrinth.
