The Astrolabe

For three centuries, the Order believed the ancient sanctuary was sealed by key or word of mouth. They were mistaken. The great threshold yields only to the sacred geometry of heaven.

This instrument—the Astrolabe—is the true key. Forged from cold brass and meteorite alloy, its plates capture authentic movement of stars upon a single stereographic plane.

Whoever aligns its rings with the midnight horizon can uncover the hidden bearings of the desert vaults. I recorded its anatomy here before the riders crossed the perimeter valley. Study every plate with care.

Three Rules of the Outer Dial

I. Never force the rete when the desert wind rises. The fine pointers bend under grit; once warped, a star bearing can mislead by a dozen leagues.

II. The central pin locks with an iron horse wedge. If the wedge slips, the altitude circles decouple from the true horizon of the sanctuary.

III. Trust the shadows at noon, but trust the pointers at midnight. When Vega reaches zenith, the gate alignment reveals its true direction.

Aequatio Temporis – Epoch of Observation
Solar declination: delta = 23° 27' . sin(lambda)
Solstitial limit: maximum elevation h = 75° 15'

"To hold the sky in one's hand is to master the path beneath one's feet."

Latitude datum: 38° 12' 04" N – Meridian of the First Tower
